

I wish speak out against mandating the ability to know the location of WiFi voice over IP devices, or for any IP devices. The packet-switched network is quite different than the current circuit-switched network. It's global internetwork which can not be regulated in the same manner. For the e911 service, or any other tracking service, the free market should be the driving force. If people would like this type of service, they can pay an extra fee for such a service. I would not want such a service, and definely would not want to pay the extra fees invovled to implement such a sevice. There are VoIP providers in other countries who could easily provide me with services which do not include such FCC regulations. Don't hurt America's emerging VoIP industry, leave it to the free market.
